

# Correct cutting of chains from the reel

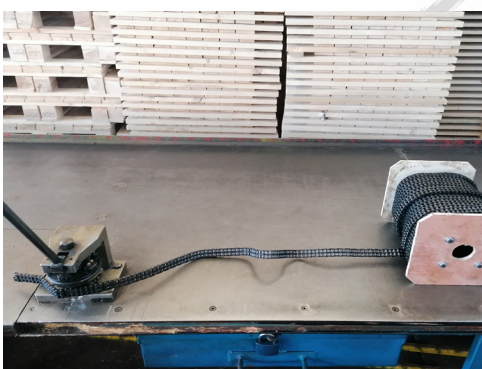

- Always work on the desk with an adequate height for a worker who's shortening the chains.
- It's appropriate to ensure the middle gap of reel with a pin directly into the desk to avoid from a spontaneous reel fall from the desk.
- Unwind the chain from the reel in vertical position (like on the photo's above) and count a required number of links.
- Push out the pins by using deviding device or on the anvil by using striking pins.
- Don't use a removed links anymore.
- The chains mustn't be twisted or too tighed.

*Too much tensed chain*

*Bad position of reel causes twisting the chain*

*We recomend you to order exact lenghts at the producer or distributor. You'll avoid the problems caused on the chains by bad cutting.*
